Moonbloom Labs

Ideas bloom overnight.

Plant an idea at night. Wake up to done.

The problem

Waiting weeks to find out whether an idea works is often the slowest part of a project.

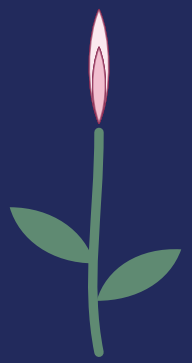

AI agents can now write and test a lot of code in one night. Moonbloom puts that to work with an architect's judgement around it: the scope is agreed with you, the build is planned and reviewed, and every decision that matters stays with people.

AI studio for working prototypes

Plant an idea at night. Wake up to done.

Moonbloom Labs is an AI studio for working prototypes. Tell us your idea in a short evening call; AI agents build it overnight, following a plan a senior architect has reviewed. In the morning you review a working prototype, its tests and a short list of decisions only you can make.

> A prototype, not a production system. We agree the scope in the evening so it fits one night.

From evening idea to morning prototype

Evening

You describe the idea

In a short call or a written brief you tell us what you want to see working. Together we cut it to a scope that fits one night.

Night

Agents build and test

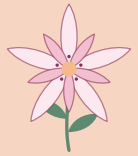

AI agents write the code and its tests, following the plan a senior architect reviewed before the build started.

Morning

Prototype, tests, demo, questions

You receive a working prototype, its tests, a short demo and a list of open questions and decisions.

Decision

Approve or refine

You decide what happens next: approve it, refine it in another night, or plan the path to production.

What you get in the morning

Everything you need to make a decision over your first coffee.

A working prototype

Something you can click through, call or try, not a slide deck.

Tests

Automated tests that show what works and what was checked.

A short demo

A walkthrough of what was built and how to try it yourself.

Open decisions and questions

A short list of choices the agents should not make for you, ready for your answers.

What we build

Six areas where an overnight prototype answers the question that matters first: does this idea work?

RAG & AI search

Ask your company documents questions and get answers with citations to the source.

Knowledge management

Turn scattered docs, wikis and chats into one searchable, maintained knowledge base.

Chatbots & AI assistants

Assistants for customer support, an internal helpdesk or onboarding new colleagues.

Gamification

Game mechanics for learning, onboarding, engagement and financial literacy.

AI integration

Language models and agents connected to your existing systems, APIs and workflows.

DevOps & cloud

CI/CD, Kubernetes, AWS, infrastructure as code and observability, so prototypes can become production systems.

A human decides. Agents build.

Moonbloom Labs is an AI studio that turns an idea into a working prototype by the next morning. AI agents do the building; a person sets the direction and approves every step.

A human decides

Agents build; people decide. You approve the scope in the evening and the result in the morning, and nothing ships without human approval.

Transparent

You see what was built, how it was tested and what is still open. The morning list of decisions shows exactly where your judgement is needed.

Secure by default

We treat your ideas and data as confidential, use sample or anonymised data where we can, and agree up front which services may process them.

Honest scope

One night builds a prototype, not a finished product. We tell you in the evening what fits, and in the morning what is still missing.

Who is behind it

[TODO: founder photo]

Michal Maxian

Founder, AI & cloud architect

Moonbloom Labs was founded by Michal Maxian, an AI and cloud architect with more than 20 years of experience in cloud, DevOps and AI/ML. He is a co-founder of an AI lab at the Slovak University of Technology in Bratislava (STU).

A path to production

Prototypes come with tests and a clear structure. When you approve one, our DevOps and cloud work can take it to production.

Refine

Another night on the parts you want changed

Pilot

Put it in front of real users with real data

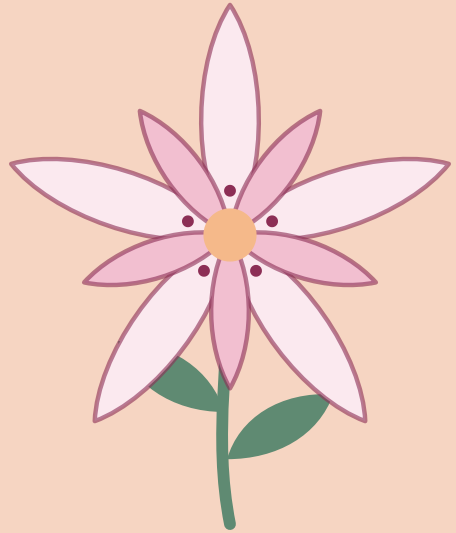

Production

Deploy it properly with our DevOps & cloud work

Have an idea for tonight?

Tell us about it. We'll reply to agree the scope and an evening to start.
